DataSheet

1 General Description

Power inverters in solar photovoltaic systems are often connected directly to the electricity grid in order to inject the created energy into the mains and act as an electricity supplier. This energy must comply with certain regulations that set the standard in terms of quality and safety which requires of accurate measurements.

The AS8002 is a highly accurate measurement IC that allows monitoring the generated energy with low cost shunt resistors or other sensors for the current and resistor dividers for the voltage.

This approach allows avoiding more expensive sensing devices while achieving the required accuracy for DC and AC measurements of current and voltage, as well as stability over the operating temperature range of the inverter.

The 12-bit ADC samples the voltage and current and provides their instantaneous values through an SPI interface.

The 12-bit ADC is preceded by low noise programmable gain amplifiers in order to accommodate different sensors.

The ADC has three multiplexed inputs, offering one secondary channel in addition to the main voltage and current.

The on-chip temperature sensor provides the inverter designer the option of temperature compensation for any of the measured parameters or functional blocks provided, over the full operating temperature range of the device.

The on-chip voltage reference is connected to the ADC and to REF.

An external crystal oscillator is not required as a high accuracy internal oscillator clock is available.

The independent over current interrupt detects a high current on the grid and allows the processor to open the switches without waiting for the ADC conversion.

2 Key Features

- 12-Bit 100 kSPS ADCs for accurate voltage and current measurement
- Programmable gain amplifiers to accommodate for different sensors

22 austria**micro**systems

a leap ahead in analog

- Three multiplexed inputs to the 12-Bit ADC for secondary measurements that require high accuracy and fast sampling rates
- On chip temperature sensor connected to one of the inputs of the multiplexer
- On-chip voltage reference with small temperature coefficient (10ppm/K typ). This reference is available at the pin REF.
- Low power on chip oscillator
- SPI compatible interface
- Internal registers for easy offset and gain compensation
- Interrupt alerts (including Under Voltage Lock-Out and Over Temperature)
- Independent programmable over current interrupt

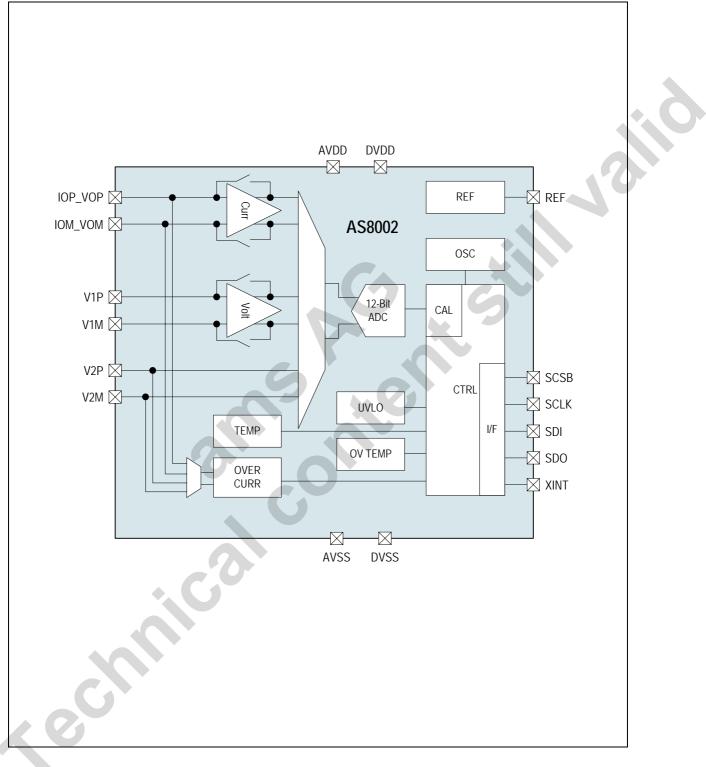

3 Applications

The AS8002 is suitable for PV inverter grid monitoring, Wind inverter grid monitoring, Isolated voltage sensing, Uninterruptible Power supplies and Power conditioners.

4.1 Pin Descriptions

Table 1. Pin Descriptions

	Pin Name Pin Number		Pin Type	Description
	IOP_VOP	1	Analog pin	Analog Input Channel 0. Positive input of the differential analog input.
	IOM_VOM	2	Analog pin	Analog Input Channel 0. Negative input of the differential analog input.
	V1P 3		Analog pin	Analog Input Channel 1. Positive input of the differential analog input.
	V1M	4	Analog pin	Analog Input Channel 1. Negative input of the differential analog input.
	V2P	5	Analog pin	Analog Input Channel 2. Positive input of the differential analog input.
	V2M6REF7AVSS8		Analog pin	Analog Input Channel 2. Negative input of the differential analog input.
			Analog pin	Reference Positive Input Voltage.
			Supply pin	Ground reference for the analog circuitry.
	DVSS	9	Supply pin	Ground reference for the digital circuitry.
	XINT	10	Digital input/output pin	Interrupt pin, active low
	SDO	11	Digital output pin	Serial peripheral interface (SPI): Serial Data Output
	SDI	12	Digital input pin	Serial peripheral interface (SPI): Serial Data input
	SCLK	13	Digital input pin	Serial peripheral interface (SPI): Serial Clock
	SCSB	14	Digital input pin	Serial peripheral interface (SPI): Serial Chip Select (active low)
	DVDD 15		Supply pin	Digital positive supply
	AVDD	16	Supply pin	Analog positive supply
	AVSS	PAD	Supply pin	Ground reference for the analog circuitry.

Note: Pin number assignment is likely to change.

5 Absolute Maximum Ratings

Stresses beyond those listed in Table 2 may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in Block Electrical Characteristics on page 6 is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

7 Detailed Description

Figure 3 presents a typical application schematic for the AS8002 used for voltage and current measurement of a device connected to the grid such a solar inverter or microinverter.

The external circuitry comprises the power supply unit that is connected to the grid signal and that generates a stable DC voltage which is the supply of the AS8002 and the digital isolation. Both current and voltage are scaled down and filtered prior to be sensed by the AS8002. In the case of the voltage, a resistor divider is enough to scale down the voltage. In the case of the current, a low ohmic shunt resistor should be used. The value of this shunt resistor should be calculated in order not to saturate the inputs of the AS8002 but to provide a good signal to noise ratio. It is also important to minimize the value of the shunt resistor to lower the losses and increase the overall efficiency.

Unlike commonly used sensing methods, the AS8002 is connected to the same potential level as the grid, which allows using a low cost shunt resistor as the sensing device. The isolation is achieved by means of a digital isolator which should be able to handle a data rate of up to 2Mbps. This sensing solution has several advantages compared to other common solutions, like the stability over temperature, accuracy of the measurements and allowed bandwidth. All these lead to an accurate control of the DC-AC converter with low DC injection currents.

7.1 Operating Modes

When the supply voltage is below the threshold VPOR, the AS8002 is in Reset mode. Once the supply voltage is higher than VPOR, the AS8002 goes into Off mode during its initialization time tINIT. In this mode, the current consumption is reduced and only the Control register can be read or written. Once the register bit chip_en has been set to 1, the chip goes into On mode and can be normally used after twakeup. The chip can go immediately back to Off mode by setting chip_en to 0.

Table 5. Characteristics

Parameter	Description	Min	Мах	Unit
Vpor	POR threshold voltage		2.6	V
tinit	Initialization time		3	ms
twakeup	Wake up time		300	μs

7.2 SPI Interface

The 16-bit SPI interface enables read / write access to the register blocks and is compatible to a standard micro controller interface, using SPI Mode 3 (SCLK initial state = high, data latched with rising edge of SCLK).

The SPI module is active as soon as pin SCSB is pulled low. The AS8002 is then ready to read the 8-bit SPI address on the SDI input with every rising edge of SCLK and writes on its SDO output with the falling edge of SCLK. After 16 clock cycles SCSB has to be set back to high status in order to reset the interface for the next read/write cycle.

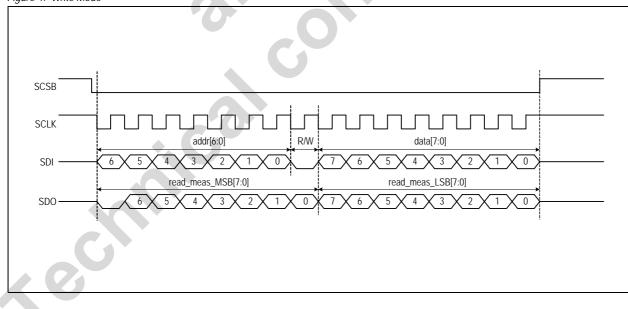

The address is split into an upper 7 bit address (addr[0...6]) and a lower 8th bit (R/W) containing the read/write information.

Writing data to the AS8002 is established by setting the R/W bit to 0. The 8 bits following this bit on SDI contain the data to be written into the address specified in the first 8 bits.

Reading data is established by setting the R/W bit to 1. The 8 bits following this bit on SDO contain the data from the address specified in the first 8 bits on SDI.

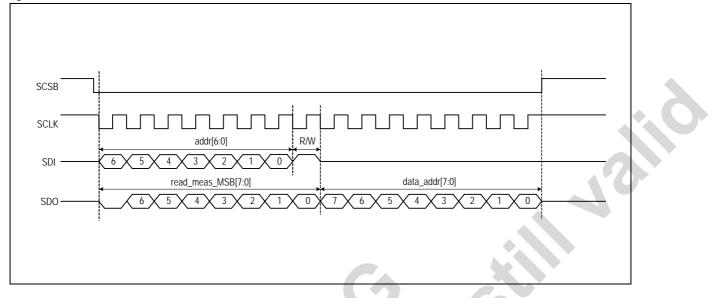

7.3 SPI Interface Data Transfer Protocol

austriamicrosystems

Figure 5. Read Mode

The interface of the AS8002 corresponds to a 4-wire SPI where each data transfer is composed of 16 bits. Each 16-bit transfer of the SDI is divided into a 7-bit address word indicating the target register, one R/W bit indicating the operation to be done and a 8-bit word data indicating the data to be written.

The data transferred in SDO is also composed of 16 bits. These can be divided into the 8 MSBs which correspond to the 8 MSBs of the last conversion run by the ADC plus 8 LSBs which clock out the data that has been requested by the SDI in that same cycle. This allows for a given read register to be addressed and read in the same 16-bit transfer.

7.4 SPI Hardware Connection

Figure 6 shows a basic interconnection diagram of an AS8002 device with a host controller. Data transmission is enabled with signal SCSB (SS/), the serial clock is applied at pin SCLK (SCK). Data is shifted into the AS8002 via signal SDI (MOSI) and read from the AS8002 via signal SDO (MISO).

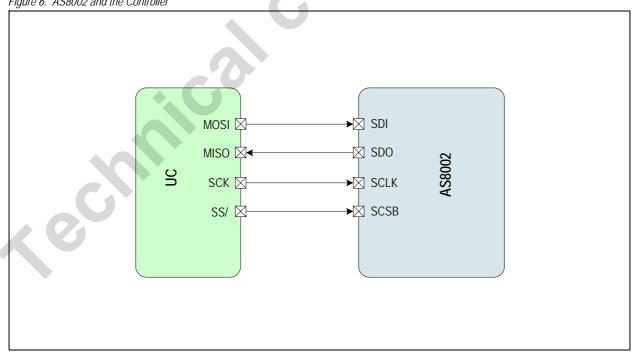

Figure 6. AS8002 and the Controller

7.5 SPI Timing

Figure 7. Timing Diagram

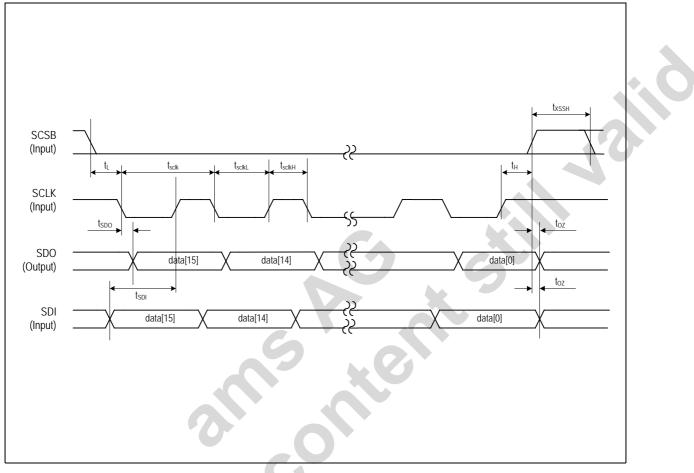

Table 6. Timing Characteristics

Parameter	Description	Min	Мах	Unit
tL	Time between SCSB falling edge and SCK rising edge	350		ns
tSCLK	Serial clock period	100		ns
tSCLKL	Low period of serial clock	50		ns
tsclkh	High period of serial clock	50		ns
ţH.	Time between last falling edge of SCK and rising edge of SCSB	t _{SCK} / 2		ns
txssh	High time of SCSB between two transmissions	350		ns
tsDI	Data input valid to rising clock edge	20		ns
tsDO SCLK falling edge to data output val			20	ns

Note: The data on SDO initially reflects the data corresponding to the previous command on SDI. Hence, in write mode, the full 16-bit data of a measurement can be read.

7.6 Measurement Example

The following example shows a simple way to alternately read the voltage and current values:

Bits [b2:b0] in Addr 03h control the ADC input multiplexer:

Name	Addr	Default				Cor	ntent			
Name	Auui	Delduit	b7 b6		b5	b4	b3	b2	b1	b0
Input Multiplexer	03h	00h				adc_en		mux_sel[2:0] 0: Current channel PGA output 1: Voltage channel PGA output		GA output

1. Select the Current channel input (IOM, IOP) : 0610h

- Set the Address [A6:A0] to 03h,

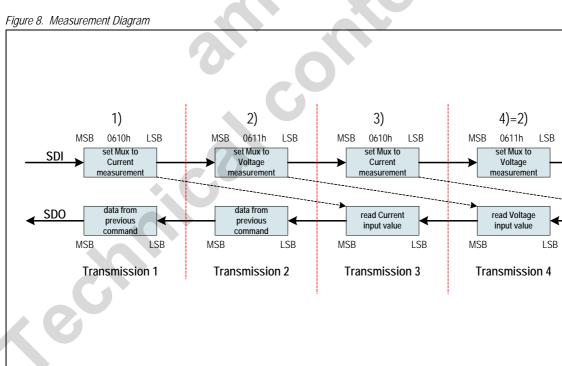

- Set the R/W bit to 0 (write mode) and the data to 10h (adc_en = 1, mux_sel = 0)

- In parallel to writing the 16-bit data on SDI, a set of 16-bit data can be read on SDO, which contains the data from the second to last command.

- 2. Select the Voltage channel input (V1M, V1P) : 0611h
 - Set the Address [A6:A0] to 03h,
 - Set the R/W bit to 0 (write mode) and the data to 11h (adc_en = 1, mux_sel = 1)

- In parallel to writing the 16-bit data on SDI, a set of 16-bit data can be read on SDO, which contains the data from the second to last command.

- 3. Change the input multiplexer back to Current channel input (IOM, IOP) : 0610h - Repeat the sequence 1 above: addr = 03h, data = 10h,
 - The 16-bit current input data from the second to last invoked command (1 above) can be read on SDO.
- 4. Loop sequences 2 and 3
- Note: In sequence 2, the 16-bit voltage input data from the second to last command can be read on SDO.

Note: The 16-bit input data from the voltage and current measurements contain the ADC data in the lower 12 bits and two status bits in the upper 4 bits (see Register Map Table on page 15).

Table 7. Current and Voltage Measurements

Name			Content		
Name	b15	b14	b13	b12	b11:b0
Current Measurement	0	warning_detected	interrupt_detected	Х	curr_meas
Voltage Measurement	0	warning_detected	interrupt_detected	Х	volt_meas

7.7 Measurement Control and Calibration

The conversion starts on SCSB falling edge when **adc_en** is a 1. The value of the result of the conversion can be read at the next SPI write command 10µs later.

Figure 9. ADC Burst Mode

SCSB			G	6	
channel measured	Not updated	Channel_1	X	channel_2	channel_3
channel read		Not updated	χ	channel_1	Channel_2
		ans	A.C.		

Read_meas will be transferred to the Current, Voltage or Auxiliary measurement upon mux_sel[2:0] value – curr_meas, volt_meas or aux_meas.

Calibration is done according to the formulas:

For current channel:

read_meas = adc_meas * (1024 + pga_curr_gain_cal) / 1024	(EQ 1)
--	--------

For voltage channel:

For auxiliary channel:

read_meas = adc_meas * (1024 + aux_gain_cal) / 1024 (EQ 3)

Note: The Raw ADC results are also available in the registers and are called adc_meas[11:0]

7.8 Interrupts

When an over current, an under voltage or an over temperature occurs the bit warning_detected is set to 1.

The interrupt state is present on interrupt_detected and on the pin XINT.

The statuses are available in the register Interrupt Status. It contains the bits **over_currrent_int_en**, **under_voltage_int_en**, **over_temp_int_en**.

The generation of the interrupt can be enabled or disabled in the register "Interrupt Enable". It contains the bits **over_currrent_int_i**, **under_voltage_int_i**, **over_temp_int_i**.

Values of the register Interrupt Status are kept until this register is read.

7.10 Register Description

Table 9. 01h

Co Access R/W R/W R/W	Description 0: Chip in complete power off 1: Chip on 0: Temperature sensor disabled 1: Temperature sensor enabled 0: Current channel PGA disabled
R/W R/W	0: Chip in complete power off 1: Chip on 0: Temperature sensor disabled 1: Temperature sensor enabled
R/W	1: Chip on 0: Temperature sensor disabled 1: Temperature sensor enabled
	1: Temperature sensor enabled
R/W	0: Current channel PGA disabled
	1: Current channel PGA enabled
R/W	0: Voltage channel PGA disabled 1: Voltage channel PGA enabled
R/W	0: Internal ADC reference voltage off 1: Internal ADC reference voltage on Note: This bit must be set to allow ADC measurements.
R/W	0: Over current detector disabled 1: Over current detector enabled
R/W	0: Over current detector connected to inputs IOP_VOP and IOM_VOM 1: Over current detector connected to inputs V2P and V2M

Table 10. 02h

Table 10. 02	?h		6				
Address:		PGA Gain Register					
	02h		Contro	ols the gain of the current and voltage channel PGAs			
Bit	Bit Name	Default	Access	Description			
4:0	ngo curr goin	00h	R/W	Gain for current channel is given by the formula:			
4.0	pga_curr_gain	0011	R/W	2*pga_curr_gain+2	(EQ 4)		
7.4	nga volt gain	0h	R/W	Gain for voltage channel is given by the formula:			
7:6	pga_volt_gain	UN	rt/W	2*pga_volt_gain+2	(EQ 5)		

Table 11. 03h

	Address:			Input Multiplexer Register				
03h			Controls the ADC and select the channel to be converted					
Bit	Bit Name	Default	Access	Description				
2:0	mux_sel	00h	R/W	Select the input to be converted: 0: Current channel PGA output 1: Voltage channel PGA output 2: V2P and V2M 3: AVDD and AVSS 4: IOP_VOP and IOM_VOM 5: V1P and V1M 6: Reserved 7: Reserved				
4	adc_en	0h	R/W	Enable the ADC conversion that will start on the next SCSB falling edge				

Table 12. 04h

Address: 04h		Over Temperature Threshold Register				
		Set the over temperature threshold value				
Bit	Bit Name	Default	Access	Description		
7:0	over_temp_thres	FFh	R/W	Over temperature detection is triggered when temp value is higher than over_temp_thres		

Bit	Bit Name	Default	Access	Description
7:0	over_temp_thres	FFh	R/W	Over temperature detection is triggered when temp value is higher than over_temp_thres
Table 13. 05	5h			
Address: 05h				Interrupt Enable Register
				Separately enables the interrupts
Bit	Bit Name	Default	Access	Description
0	over_temp_int_en	Oh	R/W	0: Interrupt due to over temperature is disabled 1: Interrupt due to over temperature is enabled
1	under_voltage_int_en	Oh	R/W	0: Interrupt due to under voltage is disabled 1: Interrupt due to under voltage is enabled
2	over_current_int_en	0h	R/W	0: Interrupt due to over current is disabled 1: Interrupt due to over current is enabled

	Address:			Over Current Range Register	
	06h		Set the	over current comparators absolute threshold voltage	
Bit	Bit Name	Default	Access	Description	
				The threshold voltage is given by the formula:	
7:0	over_current_range	FFh	R/W	over_current_range*1m	(EQ 6)
				Where: over_current_range should be higher than 10h	
Table 15. 10)h				
TADIE 15. TO	///				

(C

	Address:		Current Measurement MSB Register Gives measured value of current (MSB) and status of warnings and interrupts						
10h		Give							
Bit	Bit Name	Default	Access	Description					
3:0	curr_meas[11:8]	Oh	R	MSB of current channel measurement, value is given as 2's complement number by the formula:					
				I=curr_meas*1.22m / (Rshunt*curr_gain) (EQ 7)					
5	interrupt detected	Oh	R	Same value as XINT (complemented) 0: No interrupt detected 1: Interrupt is detected					
6	warning detected	0h	R	Over temperature, under voltage or over current detected 0: No warning detected 1: Warning detected					

Table 16. 11h

Address: 11h		Current Measurement LSB Register					
		Gives measured value of current (LSB)					
Bit	Bit Name	Default	Access	Description			
7:0	curr_meas[7:0]	0h	R	LSB of current channel measurement, value is given as 2's complement number by the formula:			
				I=curr_meas*1.22m / (Rshunt*curr_gain) (EQ 8)			

7:0	curr_meas[7:0]	0h	R	LSB of current channel measurement, value is given as 2's complement number by the formula:		
				I=curr_meas*1.22m / (Rshunt*curr_gain) (EQ		
able 17. 12	Ph					
Address: 12h				Voltage Measurement MSB Register		
		Giv	Gives measured value of voltage (MSB) and status of warnings and interrupts			
Bit	Bit Name	Default	Access	Description		
3:0	volt_meas[11:8]	Oh	R	MSB of voltage channel measurement, value is given as 2's complemer number by the formula:		
			K	volt_meas*1.22m / volt_gain (EQ		
5	interrupt detected	Oh	R	Same value as XINT (complemented) 0: No interrupt detected 1: Interrupt is detected		
6	warning detected	0h	R	Over temperature, under voltage or over voltage detected 0: No warning detected 1: Warning detected		

Table 18. 13h

Address: 13h		Voltage Measurement LSB Register				
		Gives measured value of voltage (LSB)				
Bit	Bit Name	Default	Access	Description		
7:0	volt_meas[7:0]	Oh	R	LSB of voltage channel measurement, value is given as 2's complem number by the formula:	ent	
				volt_meas*1.22m / volt_gain (EC	2 10)	

Table 19. 14h

	Address: 14h		Auxiliary Measurement MSB Register			
			Gives me	Gives measured value of auxiliary channel (MSB) and status of warnings and interrupts		
	Bit Bit Name		Default	Access	Description	
	3:0	aux_meas[11:8]	0h	R	MSB of auxiliary channel measurement, value is given as 2's complement number by the formula:	
					aux_meas*1.22m (EQ 11)	
	5	interrupt detected	0h	R	Same value as XINT (complemented) 0: No interrupt detected 1: Interrupt is detected	
	6	warning detected	0h	R	Over temperature, under auxiliary or over auxiliary detected 0: No warning detected 1: Warning detected	

Table 20. 15h

Address: 15h		Auxiliary Measurement LSB Register			
		Gives measured value of auxiliary channel (LSB)			
Bit	Bit Name	Default	Access	Description	
7:0	aux_meas[7:0]	0h	R	LSB of auxiliary channel measurement, value is given as 2's complement number by the formula:	
				aux_meas*1.22m (EQ 12)	

Table 21. 16h

Address: 16h		Temperature Measurement Register				
			Gives measured value of temperature			
Bit	Bit Name	Default	Access	Description		
7:0	tomp	0h	R	Temperature value (in °C) is given by the formula:		
7.0	temp	UI	К	92+temp*3/4 (EQ 13)		
Table 22. 17	'h					

Address:		Interrupt Status Register					
	17h		Gives status of each interrupt source				
Bit	Bit Name	Default	Access	Description			
0	over_temp_i	0h	R	0: over temperature not detected 1: over temperature detected			
1	under_voltage_i	0h	R	0: under voltage not detected 1: under voltage detected			
2	over_current_i	0h	R	0: over current not detected 1: over current detected			

Table 23. 18h

Address: 18h		ASIC ID 1 Register			
		Provides Chip identification			
Bit	Bit Name	Default	Access	Description	
7:0	asic_id	02h	R	Chip indentification	
Table 24. 19h					

(v

	Address: 19h		ASIC ID 2 Register			
			Provides chip version number			
Bit	Bit Name	Default	Access	Description		
7:0	asic_version	5Xh	R	50h: Chip version 0 51h: Chip version 1		

Table 25. 1Ah

Address:			Raw ADC Results MSB Register					
	1Ah	Give	Gives measured value of the ADC (MSB) and status of warnings and interrupts					
Bit	Bit Name	Default	Access	Description				
3:0	adc_meas[11:8]	0h	R	MSB of raw ADC measurement, value is given as 2's complement number by the formula:				
			adc_meas*1.22m (EQ 14)					
5	interrupt detected	0h	R	Same value as XINT (complemented) 0: No interrupt detected 1: Interrupt is detected				
6	warning detected	0h	R	Over temperature, under voltage or over current detected 0: No warning detected 1: Warning detected				

Table 26. 1Bh

Address: 1Bh		Raw ADC Results LSB Register				
		Gives measured value of raw ADC (LSB)				
Bit	Bit Name	Default	Access	Description		
7:0	adc_meas[7:0]	Oh	R	LSB of raw ADC measurement, value is given as 2's complement number by the formula:		
				adc_meas*1.22m (EQ 15)		
Table 27. 34	\h					

Table 27. 3Ah

Address: 3Ah		PGA Current Gain Calibration Register			
		Set value of correction coefficient for current measurement			
Bit	Bit Name	Default	Access	Description	
7:0	pga_curr_gain_cal	00h	R/W	Correct the measured current value multiplying it by the following fa where pga_curr_gain_cal is a number defined as 2's complement:	actor,
				(1024 + pga_curr_gain_cal) / 1024 (ł	EQ 16)

Table 28. 3Bh

Address: 3Bh		-0		PGA Voltage Gain Calibration Register
		Set value of correction coefficient for voltage measurement		
Bit	Bit Name	Default	Access	Description
7:0	pga_volt_gain_cal	00h		Correct the measured voltage value multiplying it by the following factor, where pga_volt_gain_cal is a number defined as 2's complement:
	155 -		(1024 + pga_volt_gain_cal) / 1024 (EQ 17)	

Table 29. 3Ch

	Address: 3Ch		Auxiliary Channel Gain Calibration Register Set value of correction coefficient for auxiliary measurement				
	Bit	Bit Name	Default	Access	Description		
	7:0	aux_gain_cal	00h	R/W	Correct the measured value of the auxiliary channel multiplying it by the following factor, where aux_gain_cal is a number defined as 2's complement:		
					(1024 + aux_gain_cal) / 1024 (EQ 18		

8 Application Information

Table 30 provides examples of Gain selection of Channel 1 for different shunt resistors and maximum RMS currents.

Table 30. Gain Selection

Shunt Resistor Value	Sensing RMS Current (A)	Recommended Linear Gain for Channel 1 for ADC to work in 80% of dynamic range	
7.5 mΩ	1.5	Gain1 = 64	
10 mΩ	1.5	Gain1 = 48	
5 mΩ	3	Gain1 = 48	
7.5 mΩ	3	Gain1 = 32	
10 mΩ	3	Gain1 = 24	
5 mΩ	6	Gain1 = 24	
7.5 mΩ	6	Gain1 = 16	
10 mΩ	6	Gain1 = 12	

8.1 Application Hints

Grounding and Layout. The analog and digital supplies of the AS8002 (AVDD, DVDD, AVSS, DVSS) are independent and separately pinned out to minimize coupling between the analog and digital sections of the device. The printed circuit board (PCB) that houses the AS8002 should be designed such that the analog and digital sections are separated and confined to certain areas on the board. This design facilitates the use of ground planes that can be easily separated.

To provide optimum shielding for ground planes, a minimum etch technique is generally best. All VSS pins of the AS8002 should be sunk in the ground plane. Digital and analog ground planes should be joined in only one spot. If the AS8002 is in a system where multiple devices require an AVSS and DVSS connection, this connection should still be made at one point only; a star ground point that should be established as close as possible to the ground pins on the AS8002.

Avoid running digital lines under the device as this couples noise into the chip. However, the analog ground plane should be allowed to run under the AS8002 to avoid noise coupling. The power supply lines to the AS8002 should use as large trace width as possible to provide low impedance paths and reduce the effects of glitches on the power supply line.

Likewise, the positive supply pins AVDD and DVDD should be connected only at one common star point close the output of the power supply. For best performance of the analog blocks of the AS8002, it is important to have a clean, noise-free supply voltage at AVDD.

To avoid radiating noise to other sections of the board, fast switching signals, such as clocks, should be shielded with digital ground, and clock signals should never run near the analog inputs. Avoid crossover of digital and analog signals. To reduce the effects of feedthrough within the board, traces on opposite sides of the board should run at right angles to each other. A microstrip technique is the best method but is not always possible with a double sided board. In this technique, the component side of the board is dedicated to ground planes, while signals are placed on the opposite side.

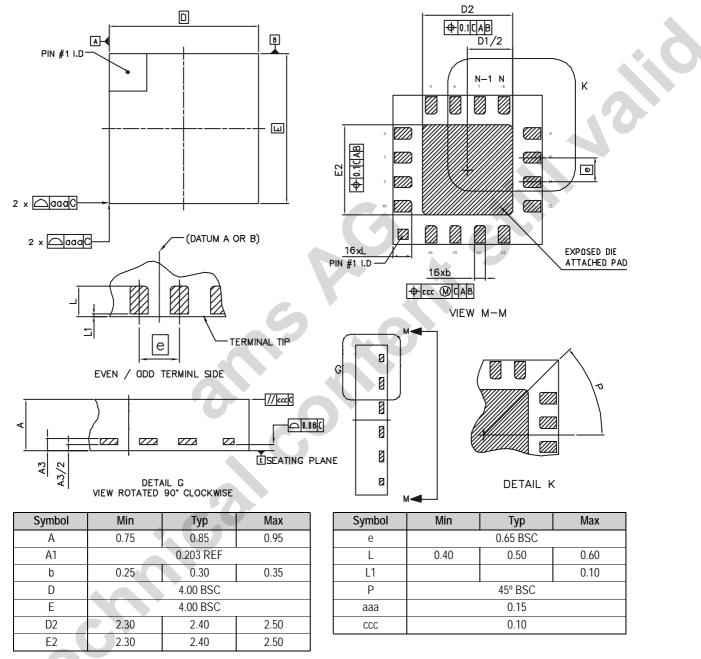

Good decoupling is also important. All analog supplies should be decoupled with 10μ F ceramic capacitors in parallel with 0.1μ F capacitors to GND. Refer to Typical Application Circuit (page 9). To achieve the best results from these decoupling components, they must be placed as close as possible to the device The 0.1μ F capacitors should have low effective series resistance (ESR) and low effective series inductance (ESI), such as common ceramic types or surface-mount types. These low ESR and ESI capacitors provide a low impedance path to ground at high frequencies to handle transient currents due to internal logic switching.

Data Sheet - Package Drawings and Markings

9 Package Drawings and Markings

The device is available in a 16-pin QFN (4x4x0.9mm) package.

Notes:

- 1. Dimensioning and tolerancing conform to ASME Y14.5M-1994.
- 2. All dimensions are in millimeters, angles are in degrees.
- 3. Dimension b applies to metallized terminal and is measured between 0.25 and 0.30mm from terminal tip. Dimension L1 represents terminal full back from package edge up to 0.1mm is acceptable.
- 4. Coplanarity applies to the exposed heat slug as well as the terminal.
- 5. Radius on terminal is optional.

Data Sheet - Revision History

Revision History

Revision	Date	Owner	Description	
1.0	14 May, 2010	jja	Initial revision	
1.1	25 Aug, 2010	spo	Updated the following in Register Map (page 15): 1) Register bit b4 at address 01 (previously under_voltage_en) is now adc_ref_en 2) ASIC ID 2 register value is now 5Xh	

Note: Typos may not be explicitly mentioned under revision history.

10 Ordering Information

The devices are available as the standard products shown in Table 31.

Table 31. Ordering Information

Ordering Code	Description	Delivery Form	Package
AS8002 AQFP	Temperature: -40°C to 125°C	Tape & Reel in Dry Pack; 6000 pieces / reel	16-pin QFN (4x4x0.9mm)

Note: All products are RoHS compliant and Pb-free.
