

LCP02-150B1

A.S.D.™

PROTECTION IC FOR RINGING SLICs

FEATURES

- Protection IC recommended for ringing SLICs.
- Wide firing voltage range: from -110V to +95V.
- Low gate triggering current: $I_G = 5\text{mA max.}$
- Peak pulse current: $I_{PP} = 30\text{A (10/1000}\mu\text{s)}$.
- Holding current: $I_H = 150\text{mA min.}$
- UL497B approved (file E136224)

MAIN APPLICATIONS

- Dual battery supply voltage SLICs
 - negative battery supply configuration
 - negative & positive battery supply configuration
- Central Office (CO)
- Private Branch Exchange (PBX)
- Digital Loop Carrier (DLC)
- Asymmetrical Digital Subscriber Line (ADSL G.Lite)
- Fiber in the Loop (FITL)
- Wireless Local Loop (WLL)
- Hybrid Fiber Coax (HFC)
- ISDN Terminal Adapter
- Cable modem

DESCRIPTION

The LCP02-150B1 has been developed to protect SLICs operating on both negative and positive battery supplies, as well as on high voltage SLICs. It provides crowbar mode protection for both TIP and RING lines. The surge suppression is assumed for each wire by two thyristor structures, one dedicated to positive surges the second one for negative surges. Both positive and negative threshold levels are programmable by two gates (Gn and Gp). The use of transistors decreases the battery currents during surge suppression.

The LCP02-150B1 has high Bellcore Core, ITU-T and FCC Part 68 lightning surge ratings, ensuring rugged performance in the field. In addition, it is also specified to assist a designer to comply with UL1950, IEC950 and CSA C22.2. It is UL 497B approved (file E136224), and has UL94-V0 resin approved

ELECTRICAL CHARACTERISTICS ($T_{amb} = 25^{\circ}\text{C}$)

1 - PARAMETERS RELATED TO THE NEGATIVE SUPPRESSOR

Symbol	Parameter	Test conditions	Min.	Max.	Unit
I_{Gn}	Negative gate trigger current	$V_{Gn/GND} = -60\text{V}$ Measured at 50Hz		5	mA
I_{H-}	Holding current (see fig.2)	Go-No Go test, $V_{Gn} = -60\text{V}$	150		mA
I_{RGL-}	Reverse leakage current Gn/Line	$T_j = 25^{\circ}\text{C}$, $V_{Gn/line} = -190\text{V}$		5	μA
V_{DGL-}	Dynamic switching voltage Gn / Line (see note 2)	$V_{Gn/GND} = -60\text{V}$ 10/1000 μs 1kV $R_P = 25\Omega$ $I_{PP} = 30\text{A}$ 10/700 μs 2kV $R_P = 25\Omega$ $I_{PP} = 30\text{A}$ 1.2/50 μs 2kV $R_P = 25\Omega$ $I_{PP} = 30\text{A}$		18 8 15	V

2 - PARAMETERS RELATED TO THE POSITIVE SUPPRESSOR

Symbol	Parameter	Test conditions	Min.	Max.	Unit
I_{Gp}	Positive gate trigger current	$V_{Gp/GND} = 60\text{V}$ Measured at 50Hz		5	mA
I_{RGL+}	Reverse leakage current Gp/LINE	$T_j = 25^{\circ}\text{C}$, $V_{Gp/line} = +190\text{V}$		5	μA
V_{DGL+}	Dynamic switching voltage Gp / Line (see note 2)	$V_{Gp/GND} = +60\text{V}$ 10/1000 μs 1kV $R_P = 25\Omega$ $I_{PP} = 30\text{A}$ 10/700 μs 2kV $R_P = 25\Omega$ $I_{PP} = 30\text{A}$ 1.2/50 μs 2kV $R_P = 25\Omega$ $I_{PP} = 30\text{A}$		18 8 35	V

3 - PARAMETERS RELATED TO LINE/GND

Symbol	Parameter	Test conditions	Typ.	Max.	Unit
I_R	Reverse leakage current	$T_j = 25^{\circ}\text{C}$, $V_{LINE} = +90\text{V}$, $V_{GP/LINE} = +1\text{V}$ $T_j = 25^{\circ}\text{C}$, $V_{LINE} = -105\text{V}$, $V_{GN/LINE} = -1\text{V}$		5 5	μA
C_{off}	Capacitance LINE/GND	$V_R = -3\text{V}$, $F = 1\text{MHz}$, $V_{Gp} = 60\text{V}$, $V_{Gn} = -60\text{V}$	60		pF

Note 2: The V_{DGL} value is the difference between the peak line voltage during the surge and the programmed gate voltage.

Fig. 2: Relative variation of holding current versus junction temperature.

Fig. 3: Maximum non repetitive surge peak on state current versus overload duration (with 50Hz sinusoidal wave and initial junction temperature equal to +25°C).

Fig. 4: Capacitance versus reverse applied voltage (typical values) with $V_{GN} = -90\text{V}$ and $V_{GP} = +90\text{V}$.

LCP02-150B1

TECHNICAL INFORMATION

Fig. 5: LCP02 concept behavior.

Figure 5 shows the classical protection circuit using the LCP02 crowbar concept. This topology has been developed to protect the new two-battery voltage SLICs. It allows both positive and negative firing thresholds to be programmed. The LCP02-150B1 has two gates (Gn and Gp). Gn is biased to negative battery voltage -Vbat, while Gp is biased to the positive battery voltage +Vb.

When a negative surge occurs on one wire (L1 for example), a current I_{gn} flows through the base of the transistor T1 and then injects a current in the gate of the thyristor Th1 which fires. All the surge current flows through the ground. After the surge, when the current flowing through Th1 becomes less negative than the negative holding current I_{H-} , Th1 switches off. This holding current I_{H-} is temperature dependant as per figure 2.

When a positive surge occurs on one wire (L1 for example), a current I_{gp} flows through the base of the transistor T2 and then injects a current in the gate of the thyristor Th2 which fires. All the surge current flows through the ground. After the surge, when the current flowing through Th2 becomes less positive than the positive holding current I_{H+} , Th2 switches off. This holding current I_{H+} , typically 20mA at 25°C, is temperature dependant and the same figure 2 also applies.

The capacitors Cn and Cp are used to speed up the crowbar structure firing during the fast rise or fall edges. This allows to minimize the dynamical breakover voltage at the SLIC Tip and Ring inputs during fast surges. Please note that these capacitors are generally available around the SLIC. To be efficient they have to be as close as possible to the LCP02-150B1 gate pins (Gn and Gp) and to the reference ground track (or plan). The optimized value for Cn and Cp is 220nF.

The series resistors Rs1 and Rs2 designed in figure 5 represent the fuse resistors or the PTCs which are needed to withstand the power contact or the power induction tests imposed by the country standards. Taking this factor into account, the actual lightning surge current flowing through the LCP02-150B1 is equal to :

$$I_{surge} = V_{surge} / (R_g + R_s)$$

With V_{surge} = peak surge voltage imposed by the standard.
 R_g = series resistor of the surge generator
 R_s = series resistor of the line card (e.g. PTC)

e.g. : For a line card with 50Ω of series resistors which has to be qualified under Bellcore 1000V 10/1000μs surge, the present current through the LCP02-150B1 is equal to :

$$I_{surge} = 1000 / (10 + 50) = 17A$$

The LCP02-150B1 topology is particularly optimized for the new telecom applications such as fiber in the loop, WLL systems, decentralized central office for example. The schematics of figures 6 and 7 give the 2 most frequent topologies used for these emergent applications

Fig. 6: Protection of SLIC with positive and negative battery voltages.

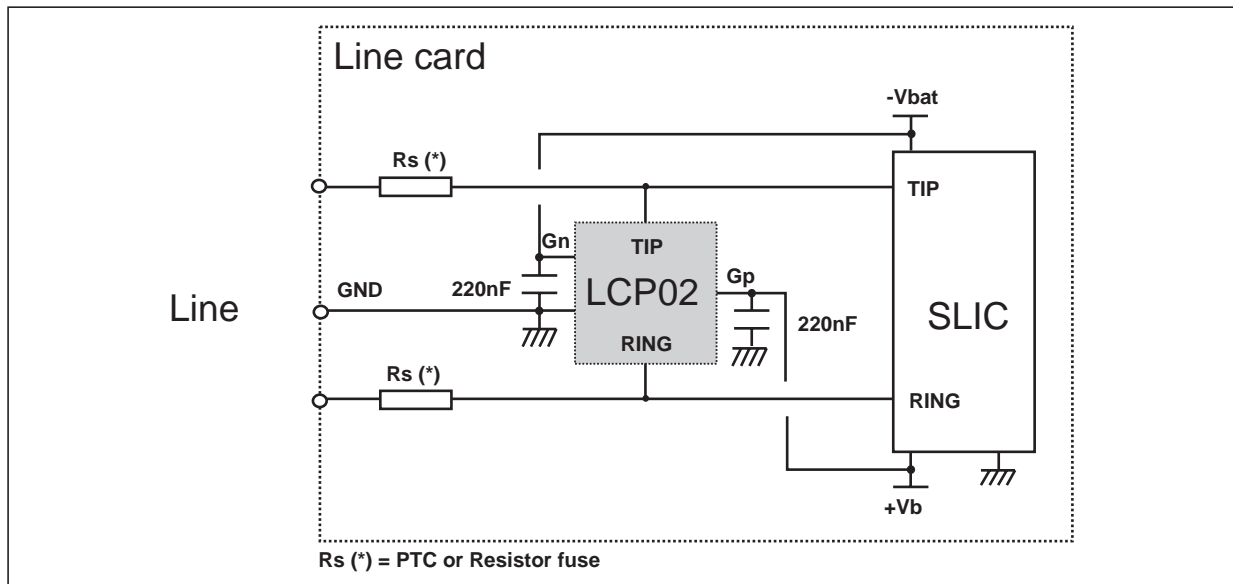

Fig. 7: Protection of high voltage SLIC

Figure 6 shows the classical protection topology for SLIC using both positive and negative battery voltages. With such a protection the SLIC is protected against surge over $+V_b$ and lower than $-V_{bat}$. In this case, $+V_b$ can be programmed up to $+95V$ while $-V_{bat}$ can be programmed down to $-110V$. Please note that the differential voltage does not exceed ΔV_{bat} max at $190V$.

Figure 7 gives the protection topology for the new SLIC using high negative voltage down to $-110V$.
